

Problem Statement

In a B2C organization, customer information, leads, interactions, complaints, and feedback are often managed through separate systems or manual processes. This makes it difficult to maintain complete customer history, track leads, resolve issues efficiently, and understand customer satisfaction.

The proposed **Customer Relationship and Management System** aims to provide a centralized platform for managing customers, leads, interactions, support tickets, and feedback, while generating useful customer insights to help the organization improve customer relationships and experience.

Project Overview

The **Customer Relationship and Management System** is a centralized software system designed to manage and improve interactions between a business and its customers. It maintains customer information, manages leads, records customer interactions, handles support tickets, collects feedback, and generates customer insights.

The system provides different functionalities for **customers, sales executives, support executives, managers, and administrators** according to their roles. By bringing customer-related activities into a single platform, the system helps employees track customer history, resolve issues efficiently, monitor customer satisfaction, and make better decisions based on customer data.

Functions

Create_Customer ()

Manage_Lead ()

Record_Interaction ()

Manage_Support_Ticket ()

Collect_Customer_Feedback ()

Generate_Customer_Insights ()

Scope

The system will provide a centralized platform to manage customer profiles, leads, interactions, support tickets, and customer feedback. It will also generate customer insights and reports while providing role-based access to customers, sales executives, support executives, managers, and administrators.

Constraints

The system depends on accurate customer data and may require third-party APIs for services such as email or SMS. Advanced AI and predictive analytics are outside the initial scope, and the system is primarily designed for academic or small-scale deployment with role-based access to protect customer information.
